FOR RELEASE JUNE 28, 2002

4340 Front Axles

Randy's Ring & Pinion now has 4340 chromemoly inner & outer front axle shafts. These axles are the strongest axles you'll find to put in your 4 wheeler. Until recently Warn was the only one to offer such a strong axle shaft. Randy's has a huge stock of these axles ready to ship immediately, no more waiting.

The 4340 material is far superior to any stock Dana type axle or any of the aftermarket 1541h designs. You'll be able to break many more u-joints before damaging the yokes and having to replace axles. They can utilize a full 360-degree retaining clip rather than using the half round clip found in stock applications. These axles are in stock for D30, D44, D60, Toyota, & Corporate GM 8.5" front ends. All of them accept a very common 297X u-joint except the D60 axles, which use the larger 332X joint.

Axles are available blank or as direct replacement for your stock axles. The custom do-it-yourselfer and any custom axle manufacturer will appreciate the blank axle shafts that can be cut to length and splined. Randy's also has in the works a stronger 297X front axle u-joint.
