

Randy's Ring & Pinion now has Traction Locks for Ford 8" rearends. These are extra heavy duty with lots of upgraded features that will outperform the original OEM design.

The case is made from billet steel and nodular iron to take the stress of high impacts and heavy loading. The clutches are produced by Raybestos ® and are designed to last longer. The spider gears are made from high quality 8620 steel and are heat treated to withstand heavy shock loads and lots of miles of abuse. These newly designed units also use four spider pinion gears instead of two. The addition of the extra spider gears doubles the strength and durability from other designs.

In addition, they are offered with two different spring pressures to fit the needs of the application. A smooth design with lighter preload spring loading is available for every day street driving. This unit still hooks up well, but has less clutch chatter than the aggressive design. The aggressive design has heavier spring preloading to aid in lockup for high performance applications.
