FOR RELEASE JUNE 28, 2002

## Full Float Axles

It seems these days everyone is going to these big & bad full floating rear ends. Rock crawlers need bulletproof and awesome tow rigs both requiring these overbuilt axles. Randy's has full float axles for a wide variety of rears including corporate GM, Ford & Dana. We've got stock replacements as well as custom width applications for the Dana rears. The Yukon axles for Dana are in lengths of 33.5, 36.5 & 39.5" with 6" of splines so they can be easily cut down to the desired length. These axles are approximately 25-30% stronger than stock.

The Yukon axles are made from a 1541H alloy steel. The transition from flange to shaft is considerably thicker than a stock Dana type so it's sometimes necessary to take a little material from the end of the spindle with a grinder.

We have a large stock of all the full float axles as well as semi float axles, and 4340 Chromemoly front axles.
