FOR RELEASE JUNE 28, 2002

## **One Piece Model 20 Axles**

Randy's Ring & Pinion now has heavy duty, one-piece axle shafts for Jeep model 20 rear ends.

A leading supplier of truck and off-road differential parts, Randy's Ring & Pinion now keeps a HUGE supply of these quality axles in stock and ready to ship today. Applications include CJ5's and CJ7's that use AMC Model 20 differentials.

These heavy-duty axles are made from super strong steel, and are heat treated for extra strength and durability. Their exceptional design is many times stronger than the standard two piece tapered axles that came stock in most Model 20's.

They use American made Timken tapered roller bearings that do not need adjustment shims, which makes installation much easier than other designs which require shims for adjusting axle bearing end play. These Timken bearings hold up well under abuse or tall tires, and are readily available if they do ever wear out. New wheel studs are included that come pressed in and ready to go.
